

Tool Trap

A **Tool Trap** could prevent loss of a tool string down-hole if Slickline is pulled-off from the Rope Socket. It is normally installed between the Lubricators and the Slickline BOP in a Slickline PCE. Manual and hydraulically actuated models are available. The hydraulic model allows for operation of the tool trap from a remote location. Hydraulic Tool Traps are more commonly applied because of their safety and ease of operation.

Normally, Tool Trap applied in Slickline PCE is same to Wireline PCE.

More information please refer to [Hydraulic Tool Trap](#) in Chapter «Wireline PCE» .
